

OROVILLE FACILITIES RELICENSING

Operations Modeling Support – From Basics to Philosophy

"Model - n. A system of postulates, data, and inferences presented as a mathematical description of an entity or state of affairs" (Merriam-Webster's Collegiate Dictionary).

Philosophy of Modeling

- "All models are wrong, but some are useful."
– George Box, Professor, U. of Wisconsin
- "Entities should not be multiplied unnecessarily."
– William of Occam, 14th century logician
- "Make your theory as simple as possible, but no simpler."
– Albert Einstein
- "For every complex question there is a simple and wrong solution."
– Albert Einstein

Operations Models for Oroville Facilities Relicensing

Targeted Results	<ul style="list-style-type: none"> Water supply conditions Monthly operations and water budget 	<ul style="list-style-type: none"> Power generation Hourly operations 	<ul style="list-style-type: none"> Reservoir temperature River/Diversion temperature
Relative Scale of Decision Making	<ul style="list-style-type: none"> Water Supply Allocations Flow Requirements Responsible In-Basin Needs 	<ul style="list-style-type: none"> Flow Requirements Ramping Criteria Power Generation 	<ul style="list-style-type: none"> Intake Elevations
			Simulator Operational Rule

Key to Success 1 Matching the Modeling Purposes

- Operations models evaluate benefits and impacts of certain long-term measures.
- The acceptance of the models should be evaluated based on the ability to provide a reasonable display of long-term risks associated with proposed measures.

Key to Success 2 Getting the Right Information

The real world is perfect; the modeling world cannot fully capture its complexity. Our goal is to minimize the impacts of modeling errors on decision making in Oroville Facilities Relicensing by:

- Minimizing potential system errors through reviews for modeling biases
- Focusing on reasonableness and long-term trends for planning purposes
- Inferring from relative changes between scenarios
- Considering significance of relative changes in a real-world sense
- Looking past unsupported model precision

Key to Success 3 Managing the Modeling Effort

Collaboration among requestors, modeling coordinator, and modeling team members to accommodate more requests in a more effective and efficient manner.

Responsibilities of the modeling coordinator (Curtis Creel, DWR) include:

Prioritizing Among Requests:
Critical to relicensing program by factors including: completeness of the request, physical/legal/policy feasibility of proposed operational changes, work load of modeling team members

Consolidating Requests by:
Finding common ground, using representative conditions.
